

ABSTRACT OF THE DISCLOSURE

A system and method for providing network resources from an origin server to a client. A set of intermediary servers is topologically dispersed throughout a network.

- 5 An enhanced communication channel is provided between the set of intermediary servers and the origin server. A redirector receives address resolution requests for the origin server, selects one of the intermediary servers in response to the request, and provides a network address of
- 10 the selected intermediary servers to an entity generating the address resolution request.
